

ShareBase for Healthcare

Count on ShareBase to help you share with confidence

Explore the many use cases for ShareBase, Hyland's cloud-based, secure file sharing and collaboration application.

A number of healthcare organizations just like yours use ShareBase to control how they securely share sensitive information. Take a look at these real-world applications for inspiration on the many ways you can use ShareBase, too.

Using ShareBase:

1 As a standalone system

Store patient-record-related documents that reside outside of the EMR and allow authorized staff to securely access and share protected patient information while offsite. This can be especially handy for home health, hospice and other post-acute care organizations.

2 For secure one-way external communication

Use ShareBase to share confidential documentation with financial institutions, insurance companies and attorneys. Whether sending protected health information or a refinancing application, ShareBase easily replaces a SFTP portal for these one-way large shares.

3 To manage contract revisions

Leverage ShareBase to complement contract management tasks – like securing external redlines. This enhancement to the OnBase Contract Management solution not only adds a level of security, but also significantly speeds up contract proceedings compared to exchanging emails for redlines.

4 For sending large-sized files

Have a document too large to send via email? Rather than breaking the files up into smaller batches to fit email limitations, send large files to clinicians and providers with ShareBase.

5 To collaborate on clinical trial documentation

Capture, store and share clinical trial information—whether an image captured in the field with a mobile device or data saved in a spreadsheet—and use ShareBase to collaborate on clinical reports.

6 For sharing board meeting minutes and other official communication

ShareBase has a number of internal applications for sending internal communications to board members, foundations and other hospital associations with ShareBase to ensure controlled, secure delivery.
